

Raising the Standard: Can International Standards help save Energy and Carbon?

Ian Byrne
Principal, IBECSS Ltd

Can Standards help Save Energy?

To answer this, I will try and answer three related questions:

- What are (International) Standards?
- How do they cover energy use and carbon emissions?
- Do they actually lead to energy & carbon savings?

But first, I ought to say who I am...

Introduction – IBECCS Ltd

- Small consultancy in Milton Keynes, UK
- Ian Byrne, Principal
 - MA (Oxon) Mathematics, a long time ago
 - Chartered Accountant (FCA)
 - PhD Geography (20th Century Cartography)
 - ex-Deputy CEO, National Energy Foundation
- Over 35 years' experience in energy efficiency and low carbon, with focus on:
 - Energy and Carbon Consultancy Services
 - Practical advice for small & micro-organisations
 - International Standardisation

What are Standards?

“Standards” is an ambiguous word:

- Something to follow (a banner)
 - Moral, ethical rules
 - A marketing tool
 - Minimum acceptable, or
 - Average (a standard is not special), or
 - Ambitious (something to be attained)?
-
- Or all the above?

What are standards?

- National & international standards have elements of all the above
 - Can define for interoperability
 - Or set minimum requirements, including safety
 - Or support management systems
 - Or provide guidelines encouraging ambition
-
- Standards are always voluntary
 - Unless national governments enshrine them into law or other regulations
 - And can be subject to verification (typically certification)

How did standards bodies develop?

- Early standards focused on basic industrial applications
 - e.g. BS1 rolled sections for structural purposes
- UK grew out of Engineering Standards Committee (1901)
- Became British Standards Institution in 1931
- In Germany, DIN standards began in 1917 as Normenausschuß der deutschen Industrie (NADI)
 - A1, A2, A3, A4... Paper sizes in DIN 476:1922
- International Electrotechnical Commission, 1906
- After WWII, ISO (International Organization for Standardization) established in Geneva for non-electrical standards

What is ISO?

ISO, the International Organization for Standardization:

- 175 members (one per country = national standards body, NSB)
- 829 Technical committees and subcommittees
 - 7,857 meetings in 2024, with 89% virtual
- 26,090 International Standards and other deliverables
 - Including 1,533 published in 2024
 - A total output of 1 266 579 pages in English and French
 - 4,363 work items being progressed
 - All created by volunteer “experts” representing NSBs
- Three goals in their 2030 strategy
- Climate change of increasing interest to ISO
 - All new standards have to consider its impact

How are standards written?

» Consensus approach

- ▶ International experts from participating countries attend meetings and provide comments
- ▶ Consensus = lack of sustained objection

» Structured drafting process

- ▶ Working draft, to committee draft, draft international standard (available to public), FDIS, then International standard, each stage has a voting process: "Yes", "No", or "Abstain"
- ▶ Typically takes 36 months

» Requirements and other standards

- ▶ Guidance can become requirements if stating compliance
- ▶ Other deliverables: TS, TR & PAS

» Convenor is neutral

- ▶ Often convenor and project manager from two countries

Management system standards

Increasingly ISO has been involved in creating management system standards:

- ISO 9001, Quality management systems
 - Origins go back to British Standard BS 5750
- ISO 14001, Environmental management systems
- ISO 27001, Information security management systems
- ISO 45001, Occupational health and safety management systems
- ISO 50001, Energy management systems
- All utilize a common structure (known as Annex SL) and terms
- All based around PDCA: Plan-Do-Check-Act

ISO 50001: Energy Management

- Like other systems standards, ISO 50001 is built around around PDCA: Plan-Do-Check-Act
- Twin focus on energy use (how/what) and energy consumption (how much)
- Intended for use by wide range of organizations:
 - Industrial/Commercial
 - Public, private or non-profit

What elements are looked at?

Context of the organisation	Leadership	Resources
Energy review	Setting Energy Performance Indicators	Objectives, energy targets & action plans
Competence and awareness	Operations and maintenance (O&M)	Procurement and design
Communication & document control	Monitoring and measurement	Management review

Context

- What do we do?
- Where do we do it?
- Why are we doing this (drivers)?
- Who is making this happen?

Resources

- Capital or revenue – good management may not cost money
 - Targeting behaviour change
- Can the organization afford capital upgrades?
 - Is it waiting for a grant?
 - What's the ROI? Can it estimate the expected savings?
 - The business case for reducing costs is sometime harder than for increasing sales
 - Will it also reduce CO₂ emissions?
- What about the human element?
 - Staff motivation (and rebound effect)
 - Skills & competencies

Energy Review

- Data is important – what's available?
- Paper bills...or half hourly data
- Completeness, accuracy
- Granularity

Leisure Centre: Average half hourly consumption

Energy Consumption 2019-20

Energy used by Day of Week 2019-20

Measurement & Monitoring

- If you don't measure, you cannot manage
- Sub-metering is encouraged
- M&T systems

Not ready for 50001? Try 50005

- Smaller organizations with no experience of (say) ISO 9001 may find a full energy management system difficult to define & implement
- ISO 50005 seeks to provide a stepwise approach
- Four levels of maturity

Working with supply chain? Use 50009

- Not only for supply chains, can work where there are multiple tenants of an industrial estate or shopping mall, or in a franchise system

Energy Performance Indicators: 50006

- Explains approach to establishing energy baselines and energy performance indicators (EnPIs)
- Considers data collection and data quality
- Creation of models relating energy consumption to relevant variables (activity indicators)
 - Statistical or engineering models
 - Initial conditions at baseline period
 - Some consideration of normalization of data

BS ISO 50006:2023

BSI Standards Publication

Energy management systems — Evaluating energy performance using energy performance indicators and energy baselines

bsi.

Determining Energy Savings: 50047

- Allows energy savings to be calculated by summing individual savings (bottom up) or at the organizational level (top down)

- Takes into account:
 - Measurement periods
 - Production volumes, activity levels, operating hours (relevant variables)
 - Weather effects, variable composition of raw materials (relevant variables)
 - One off changes like new buildings, purchase or sale of subsidiaries (static factors)
 - Changes in fuel used (energy accounting)
 - Interactive effects & double counting

Determining Energy Savings: 50047

- Detailed consideration of normalization
 - Baseline period, reporting period or reference conditions
- Also considers how to avoid double counting
- Accounting for unmetered supplies, such as some biomass, fuel switching, autonomous progress and rebound effects

Determining Energy Savings: 50047

And there are more...

- TC-301, the relevant committee, lists 22 published standards
 - Including technical reports and publicly accessible specifications
 - Some are to be withdrawn owing to low sales and lack of resources to update
- Work continues on new standards - ISO 50100 on decarbonization
- But TC-207/SC7 Greenhouse Gas & Climate Change Management has responsibility for carbon calculation and net zero standards

Standard and/or project under the direct responsibility of ISO/TC 301 Secretariat ↑

ISO/IEC 13273-1:2015

Energy efficiency and renewable energy sources — Common international terminology — Part 1: Energy efficiency

ISO/IEC 13273-2:2015

Energy efficiency and renewable energy sources — Common international terminology — Part 2: Renewable energy sources

ISO 17741:2016

General technical rules for measurement, calculation and verification of energy savings of projects

ISO 17742:2015

Energy efficiency and savings calculation for countries, regions and cities

ISO 17743:2016

Energy savings — Definition of a methodological framework applicable to calculation and reporting on energy savings

ISO 50001:2018

Energy management systems — Requirements with guidance for use

ISO 50001:2018/Amd 1:2024

Energy management systems — Requirements with guidance for use — Amendment 1: Climate action changes

ISO 50002-1:2025

Energy audits — Part 1: General requirements with guidance for use

ISO 50002-2:2025

Energy audits — Part 2: Guidance for conducting an energy audit using ISO 50002-1 in buildings

ISO 50002-3:2025

Energy audits — Part 3: Guidance for conducting an energy audit using ISO 50002-1 in processes

ISO 50003:2021

Energy management systems — Requirements for bodies providing audit and certification of energy management systems

ISO 50004:2020

Energy management systems — Guidance for the implementation, maintenance and improvement of an ISO 50001 energy management system

ISO 50005:2021

Energy management systems — Guidelines for a phased implementation

ISO 50006:2023

Energy management systems — Evaluating energy performance using energy performance indicators and energy baselines

ISO 50007:2017

Energy services — Guidelines for the assessment and improvement of the energy service to users

ISO 50008:2021

Energy management systems — Guidance for implementing a common energy management system in multiple organizations

ISO/PAS 50010:2023

Energy management and energy savings — Guidance for net zero energy in operations using an ISO 50001 energy management system

ISO/TS 50011:2023

Energy management systems — Assessing energy management using ISO 50001:2018

ISO 50015:2014

Energy management systems — Measurement and verification of energy performance of organizations — General principles and guidance

ISO/TS 50044:2019

Energy saving projects (EnSPs) — Guidelines for economic and financial evaluation

ISO 50046:2019

General methods for predicting energy savings

ISO 50047:2016

Energy savings — Determination of energy savings in organizations

ISO 50048:2020

Calculation methods for energy efficiency and energy consumption variations at country, region and city levels

Climate Change Mitigation Standards

- 17 published standards, including four on adaptation
- Key quantification standards include:
 - ISO 14064-1 Greenhouse gases — Part 1: Specification with guidance at the organization level for quantification and reporting of greenhouse gas emissions and removals
 - ISO 14064-2 Greenhouse gases — Part 2: Specification with guidance at the project level for quantification, monitoring and reporting of greenhouse gas emission reductions or removal enhancements
 - ISO 14067 Greenhouse gases — Carbon footprint of products — Requirements and guidelines for quantification
- These will in future be jointly developed with the GHG Protocol

Carbon Neutrality and Net Zero

- ISO 14068-1 Carbon Neutrality requires:

- A carbon neutrality management plan, with at least 1 year's implementation
- Action begun to reduce emissions in line with the plan (see diagram)
- Offsetting of unabated emissions using high quality carbon credits

- ISO 14060 Net Zero Aligned Organizations will require:

- A net zero transition plan, broadly aligned with the Paris target of 1.5°
- A commitment to wider action to combat climate change
- Removals (including by carbon credits) of residual emissions at net zero

Carbon Neutrality and Net Zero

- ISO 14068-1 and ISO 14060 are both largely about claims
- Aim to reduce the “Wild West” with robust, verified claim

Look behind the label

We're always striving to lead the way when it comes to sustainability and the community. Take a look behind the label and discover the stories behind your favourite products.

0% NET ZERO BY 2040
We're aiming for net zero emissions - by not adding more greenhouse gases to the atmosphere than we take out - by 2040.

FAIR'S FAIR
We contribute more Fairtrade premium for tea and coffee than any other UK retailer, so farmers can invest more in their future.

FORESTS FOREVER
We've committed to zero deforestation for the sourcing of soy used for animal feed and palm oil in our products by 2025.

wholegrain wheat flakes, sultanas and wheat bran with added vitamins and iron

NUTRITION

	per 100g	per 30g serving
Serves approximately		
Typical values		
Energy (kJ/kcal)	1484	445
Energy (kJ/kcal)	151	45
Fat (g)	1.9	0.6
of which saturates	0.7	0.2
Carbohydrate (g)	68.0	20.4
of which sugars	23.0	7.0
Fibre (g)	12.0	3.6
Protein (g)	9.9	3.0
Salt (g)	0.54	0.16
Vitamin B1 (mg)	2.1	0.63
Vitamin B2 (mg)	1.2	0.36
Vitamin B3 (mg)	1.2	0.36
Vitamin B6 (mg)	1.2	0.36
Vitamin B9 (mg)	1.2	0.36
Folic Acid (µg)	170	51
Niacin (mg)	14.0	4.2
Iron (mg)	1.2	0.36
Reference Intake (RI) %		
Energy (kJ/kcal)	1484/355	445/105
Fat (g)	1.9/3.0	0.6/1.0
Carbohydrate (g)	68.0/136	20.4/41
Protein (g)	9.9/19.8	3.0/6.0
Salt (g)	0.54/1.08	0.16/0.32

INGREDIENTS
Wholegrain Wheat Flour, Water, Salt, Yeast, Sultanas, Wheat Bran, Iron, Vitamins B1, B2, B3, B6, B9, Folic Acid, Niacin.

INFORMATION
Leaves of wheat bran are a natural by-product of the milling process. They are rich in fibre and contain essential nutrients. We have added them to our flakes to make them more nutritious.

STORAGE
For Best Before (BB), see top of pack. Store in a cool dry place, away from strong odours. Best if eaten within 3 months of purchase.

M&S FOODS
SULTANA BRAN FLAKES
High in fibre
Contains vitamins & iron

So do they lead to energy savings?

- Sales or downloads are through NSBs, not centrally, so data on take-up is patchy
 - Approaching 100,000 sites have an ISO 50001 certificate
 - Significantly lower numbers than for ISO 9001, ISO 14001 or ISO 45001
 - Sales of the other standards are relatively low, and sometimes concentrated in a single country
 - One barrier is cost: typically CHF177 or local equivalent
 - ISO 50005 has been made freely available in UK (up to 100,000 downloads)
 - High cost also leads to websites with unauthorised (illegal) copies
 - One copy may also be used by a consultant to work across many organizations
- Some jurisdictions have written ISO 50001 into legislation – e.g. in UK can use as an alternative to ESOS audits (subject to certain conditions)

But does this lead to energy savings?

- Having a (legal) copy of a standard will not by itself lead to energy savings – action is required
- Always hard to identify additionality – would X have implemented measure Y if it hadn't had an energy management system or used ISO 500xx?
- Surveys & case studies show standards can help save energy, but only for well-motivated organizations
- Standards do not offer a prescription of measures to take, but provide the framework under which the most cost-effective ones are implemented
- Maybe there's a PhD research topic here! 😊

Thank you – Any Questions?
